🏆 SJSU CyberAI 2026 Hackathon

Build something amazing with AI — in one week

`San Jose State University · Summer Camp`

Teams of up to 4 · pick a track · present your project on Friday.

1 How the week works

- 🧑‍🤝‍🧑 **Form a team** — up to **4 students**.
- 🎯 **Pick one track** — LLM, Cyber-AI, or Edge AI.
- 🛠️ **Build** with our tutorials + mentors all week.
- 📊 **Present Friday** — 10 minutes, demo + story.

Start here (everyone):

- ▶️ Get-Started slides — set up your tools
- 📖 Full Handbook — every lab in depth
- 🧰 sjsujetsontool guide

> No experience needed — the tutorials walk you through everything.

2 Choose your track

🤖 1 · LLM

Build an **AI app** — propose your own idea.
Runs anywhere (laptop or Jetson).

🛡️ 2 · Cyber-AI

Use **AI for security** — find & triage bugs.
Runs anywhere (laptop or Jetson).

⚡ 3 · Edge AI

Vision / robotics on the Jetson, accelerated.
*Must demo **on the Jetson device**.*

Tracks 1 & 2 can be done on any computer. **Track 3 requires running on the Jetson** with AI acceleration (CUDA / TensorRT).

3 🤖 Track 1 — LLM: build an AI app

Propose your own application! A chatbot, a study buddy, a story generator, a code helper, a Q&A bot over your own documents — your idea.

Ideas to spark you

- A web chat app with your own personality/system prompt
- "Chat with a document" (RAG) — notes, a rulebook, a syllabus
- An **agent** that uses tools to get things done

Start here

- 🌐 Next.js + Nemotron slides · lab
- 🤖 ReAct Agents slides · lab
- 🔎 RAG app · ✍️ Prompting

Use a cloud model (NVIDIA Build / OpenAI / Anthropic) or a local model — your choice.

4 🛡️ Track 2 — Cyber-AI: AI for security

Teach an AI to think like a security analyst: scan network/code/dependencies, then decide which findings are **not secure**.

Challenge ideas

- Triage CVEs in a Python project (our sample, or your own)
- 🧃 Hunt bugs in **OWASP Juice Shop** — a deliberately vulnerable web app
- Build an agent that **explains** a vulnerability and suggests a fix

Start here

- 🛡️ AI CVE Triage slides · intro lab
- 🛠️ Tool-calling triage
- 🔄 ReAct triage · 🔎 RAG CVE

⚖️ Only test systems you are allowed to (our sample app, Juice Shop). Never attack real sites.

5 ⚡ Track 3 — Edge AI: vision & robotics on Jetson

Run real AI **on the Jetson Orin Nano** and make it **fast** with GPU acceleration. **This track must be demonstrated on the device.**

Project ideas

- 🛡️ **Security monitoring & scene understanding**
- 🚗 An **autonomous car**
- 🗣️ A **voice assistant**
- 🦾 **Perception & AI device** for robots

Start here

- 🎯 YOLO & VLM detection
- 🖼️ CNN image processing
- 🤖 ROS 2 / Isaac ROS · 🦾 LeRobot arm
- 🚀 CUDA on Jetson

🔌 Feel free to **bring your own devices/components** — a USB camera, USB microphone/speaker, or any robotic base.

> ⚡ **Acceleration counts. CUDA** runs thousands of operations in parallel; **TensorRT** makes a trained model run **faster** and cooler on the Jetson. **Measure it** — report **FPS / latency** before vs. after. 🏎️ *"8 FPS on CPU → **31 FPS** on the Jetson GPU with TensorRT"* earns bonus points.

6 🏁 How you'll be judged

Your project is evaluated on **five things**:

	Criterion
🧠	**Clarity & creativity** of your chosen idea/object(s)
🗣️	**Teamwork & presentation** — up to 4 students per team
🧪	**Performance** — leveraging the **Jetson** (e.g. CUDA & TensorRT acceleration)
🧵	**Workflow understanding** — explain your solution & process clearly
🎯	**Impact & application** — how does your idea help the community?

> You don't need a perfect product — you need a **clear story** and a **working demo**.

7 🎤 Friday presentation (required)

Challenge presentation session — 10 minutes max per team. Include:

- 👨‍💻 **Team & school** introduction
- 📸 **Demo** — images / screenshots / video of your results
- 🛠️ **Solution & steps** — what you built and how
- 🧩 **Challenges** — what was hard, how you solved it
- ⚙️ **Future improvements** — what's next
- 🌍 **Community impact** — how this helps real life

> 🎥 Record a short demo video as backup — live demos can be unpredictable!

8 🧭 Tips to win

- **Start small, then improve.** Get the simplest version working on Day 1.
- **Save your results early** — screenshots/videos as you go (great for slides).
- **Divide & conquer** — split coding, testing, slides across the team.
- **Ask mentors** — and lean on the Handbook and slides.
- **Tell a story** — problem → your solution → demo → impact.

🚀 Pick a track. Build. Demo Friday.

Get-Started ▶️ · LLM · Cyber-AI · Agents · Handbook

Have fun — and make something you're proud to show.
